## FAQ

### What is a Crypto Currency?

A cryptocurrency is a contemporary form of digital money that is designed in order to be secure and anonymous. It is a currency associated with the digital world that uses cryptography (the process of converting legible information into an un-crackable code) in order to track purchases and transfers.

### What is a blockchain?

A blockchain is a public ledger that consists of all the cryptocurrency transactions that have ever been executed. It is constantly growing, by the meaning that successfully completed blocks are added to the ledger with every new set of recordings. These blocks are added to the blockchain in a linear or chronological order. Each and every node gets a copy of the current blockchain, which is then transferred automatically into the blockchain network. What's more, the block validation system ensures that no one can tamper with the records. Rather, old transactions are preserved forever and new transactions are added to the ledger irreversibly. Anyone on the network can check the ledger and see the same transaction history as everyone else.

### What is the Index Fund ?

An index fund is a type of mutual fund with a portfolio constructed to match or track the components of a market index, such as the Standard & Poor's 500 Index (S&P 500). This type of fund aims to buy a broad array of assets in line with its mandate in order to track the general trend of the markets. An index fund provides broad market exposure, low operating expenses and low portfolio turnover. These funds adhere to specific standards (e.g. efficient tax management or reducing tracking errors) implemented by predetermined rules that stay in place regardless of the current state of the markets.
